Abstract (en)

[origin: WO0065537A1] To determine interpolated intermediate values of a sampled signal, for example a digital mobile telephone signal, the parameters a, b and c of the second-degree polynomial  $y = ax^2 + bx + c$  are determined from three known sampling values  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$ , so that intermediate values can be calculated on the basis of said polynomial. It is assumed that the signal is sampled at constant intervals d, notably at intervals normalized to  $d = 1$ , and the sampling time  $x_2 = 0$  is assigned to the know middle sampling value, so that calculation requires little hardware.
