Abstract (en)
[origin: EP1184620A2] Has a swinging or gyrator or other type of movable support (1) which holds bulbs in use (2) fixed inside a lamp reflector (4), together with replacement bulbs (3). The bulbs are linked to an axis (5) actuated manually, mechanically or automatically. Movement of the axis allows the substitution of a bulb or a group of bulbs with replacements (3). The lamp supply is routed through spherical type contacts (8) which connect a part of the circuit (6) to the lamp (4) and the other part of the circuit (7) is connected to the support which allows disconnection of the blown bulb(s) and connection of replacement bulb(s) when the support is moved by the axis. The system can be automated using a sensor which detects any electric current change.
