Abstract (en)
[origin: DE19922791A1] The invention relates to a board supported by casters (20) for attaching to a child's pushchair (1). Said board consists of a standing surface (22), whereby at least one free-running caster (26) is located on the underside of the standing surface (22) which lies opposite to the chassis (2) of the child's pushchair (1). At least one connecting element (21) connects the child's pushchair (1), or at least one attachment device mounted thereon, to at least one attachment device (28) on the standing surface (22). The length of said connecting element (21) from the standing surface (22) to the pushchair (1) can be modified. The connecting element (21) and/or the attachment device (28) are configured in such a way, that at least two connection points between the standing surface (22) and the child's pushchair (1) allow unrestricted spatial articulation. The free-running caster (26) can pivot in at least two directions.
