Abstract (en)

[origin: WO0077970A1] Several message flows that are independent of one another (e.g. messages for different addressees) are frequently transmitted via a message path having a transmission protocol with secured message transmission. Since the transmission protocol cannot often distinguish the message flows, the delivery of messages of a message flow is delayed due to the fact that a previous message of another message flow has been lost and must be repeated. The invention solves the above-mentioned problem.
