Abstract (en)
[origin: EP1186327A2] Binding support plate comprises a supporting body (19) having a distal end for receiving jaw bodies (5, 6) or guiding rails (15, 16) for the jaw bodies of a binding unit and a lower side for placing on the upper side of a board-like sliding device, and units for fixing the supporting body to the upper side of the sliding device using screws. A central region (32) of the supporting body has a lower inherent stability compared with both end regions (12, 13). At least one end region of the supporting body can be mounted on the upper side of the sliding device using fixing devices. <??>Preferred Features: The fixing devices extend across the longitudinal direction of the supporting body and across the binding longitudinal axis.
