Abstract (en)

[origin: EP1186727A1] This invention relates to a building element (52) for mounting in a pitched roof structure, which building element comprises a supporting element (78) integrally connected to a first airing element (54) and protruding from the first airing element (54) and having an outward facing surface (80) for receiving and supporting an underroof layer. The building element (52) further comprises a gutter member (56) for receiving drain water from the outer roof covering and/or the underroof layer and the gutter member (56) is integrally connected to the first airing element (54) protruding oppositely to the supporting element (78). The building element (52) constitutes an integral unit for providing support for the underroof layer at the lower edge of the pitched roof structure by the supporting element (78), and conducts drain water away from the pitched roof structure by the gutter member (56) reinforcing rigidity and strength of the building element (52). <IMAGE>
