Abstract (en)

[origin: EP1186813A1] The sealing joint comprises a rotating ring (3) mounted on the sleeve (15) located at the side of the oil enclosure (17) and a carbon segment ring (2) not in contact with the shaft (16) nor with the joint support (11). The carbon ring is supported against an annular support (9) by means of springs (7). The carbon ring radial face (20) engages the rotating ring by its radial face (19) by means of bearing grooves (24) machined in the rotating ring so as to ensure dynamic sealing without friction between the radial faces.
