Abstract (en)
An electronic instrument (10) includes a housing (12) having an interface panel (14). The interface panel includes a touch panel (20), and a number of button elements (36) are positioned over the touch panel. Each button has one part (50) adjacent to the touch panel, and an exposed surface, so that the exposed surface may be pressed by a user to contact the touch panel, and to generate a signal to the circuitry of the instrument identifying the button that was pressed based on its position on the touch panel. The touch panel may have an exposed portion (66) providing a cursor control device, or be a transparent screen overlay positioned over a display screen (22) for selecting displayed elements. <IMAGE>
