Abstract (en)
[origin: US6622779B1] The invention concerns a method for continuously casting a ferritic stainless steep strip with thickness not more than 10 mm directly from liquid metal between two cooled rolls with horizontal axes and driven in rotation, characterized in that: the liquid metal composition in weight percentages is as follows: % C+% N<=0.12; % Mn<=1; % P<=0.4; % Si<=1; % Mo<=2.5; % Cr between 11 and 19; A1<=1%; % Ti+%Nb +% Zr<=1; the rest being iron and the impurities resulting from preparation; the Upsilp index of the liquid metal ranges between 35% and 60%, Upsilp being defined by the formula: $\gamma_{\text{map}} = 420\% \text{ C} + 470\% \text{ N} + 23\% \text{ Ni} + 9\% \text{ Cu} + 7\% \text{ Mn} + 11.5\% \text{ Cr} + 11.5\% \text{ Si} + 12\% \text{ Mo} + 23\% \text{ V} + 47\% \text{ Nb} + 49\% \text{ Ti} + 52\% \text{ A1} + 189$; the surface roughness of said rolls being more than 5 μm ; in the proximity of the meniscus metal liquid present between the rolls an inerting gas is used consisting of at least 60% by volume of a gas soluble in steel.
