Abstract (en)
[origin: DE19919584A1] The invention relates to a device for detecting objects in a three-dimensional manner. The inventive device comprises at least two illustration systems which are provided with projection lenses facing the object. At least one illustration system is configured as an observation system for observing objects and at least one illustration system is provided with an elementary means that can be moved in front of the projection lens. The elementary image of the elementary means moves through the object space on an image point line. According to the invention, the elementary means is configured as a moveable elementary means with a lateral component in relation to the optical axis of the projection lens. The observation system is arranged along the image point line for observation.
