Abstract (en)

[origin: WO0077650A1] The invention concerns a device for automatically managing the switching of the digital data flow (1) of a host (3) with a common interface using at least two connectors as modules (A-B). The invention is characterised in that it uses means automatically identifying their module (A-B) once they have been inserted in each connector and switching means which interchange the routings of the flow (1) inside the host (3) and the modules (A-B). The invention is particularly applicable to digital television.
