Abstract (en)

[origin: EP1188876A1] The material consists of certain visible plates obtained by molding and joined together with an intermediate layer of insulating material, such method comprising the following phases: a)a first and a second plate are molded; b)a block of insulating material is positioned on top of the aforementioned first plate, the block having identical or similar dimensions to said first plate, on which at least one hole has been made in such a way as to form a cavity, the bottom of which is the first plate. c)said cavity is filled with a material or fluid, susceptible to hardening and having adherent or bonding properties, said material or fluid overflowing from the mouth of said cavity and d)the second plate is positioned onto said block of insulating material, which by pressure and weight enters into contact with the material or fluid of said cavity, ending up joined to it by the hardening of the latter and adhering also to said block of insulating material. <IMAGE>
