Abstract (en)

[origin: US2002027375A1] The motor vehicle comprises a swinging door (PB) and a sliding door (PC) which are mounted in the frame (BA) of the vehicle without a central post between the swinging door and the sliding door. In this vehicle, a first lock (PS) is intended to connect the swinging door (PB) to the sliding door (PC), at least one second lock (DS) is intended to connect the swinging door to the frame of the vehicle, and at least one third lock (TS) is intended to connect the sliding door (PC) to the frame (BA) of the vehicle. The first lock has two latch bolts forming a gripper which closes around a striker thus allowing one of the two doors to be closed and/or opened independently of the other door.
