Abstract (en)

[origin: WO0102807A1] In an improved method and system for transmitting the position of a vehicle to a remote location. In the present invention, the position of the vehicle is calculated at the vehicle relative to a map database. In one feature of the present invention, the vehicle navigation system calculates its position relative to the map database using map matching prior to sending that calculated position to the remote location. The position of the vehicle is then transmitted to the remote location in terms relative to the road network in the map database.
