Abstract (en)
[origin: DE19925468A1] The invention relates to a stray field probe for measuring the dielectric properties of materials. Said probe comprises generating elements for generating an electric field and shielding elements to shield the generated electric field. Said shielding elements are configured in such a way that the electric field is situated at least partially outside the shielding elements. The invention is characterised in that the shielding elements have at least two openings for decoupling the electric field in the external zone.
