Abstract (en)

[origin: EP1190638A2] A first blank (3) prepared in one step and a second blank (5) prepared in a second step are continuously combined in a further step and then locked together locally through laser welding or soldering to produce a combined blank which is then reformed in a stamping process into the coin so that the part formed by the first blank and the part formed by the second are securely fixed together. The two blanks are stored in magazines and supplied individually to the joining station.
