Abstract (en)

[origin: EP1190952A2] Disclosed is a can having a can end wall (100). The can end wall (100) includes an opening panel portion (150) which is delimited by a score line so as to define a discharge opening upon being depressed downward, an opening tab, a reclosing tab and a rivet. The reclosing tab (220) has substantially a cylindrical configuration which is closed at an upper end thereof and opened at a lower end thereof. The opening tab (210) and the reclosing tab (220) are oppositely arranged to each other and integrally connected with each other to define a tab section (200). Three tab supporting projections (110,120,120') are frusto-conically formed on an upper surface of the can end wall (100), and a cylindrical wall part is integrally formed with the can end wall (100) in such a way as to be closed at an upper end thereof by the opening panel portion (150).
