Abstract (en)

A process is provided to produce an heating radiator including the phases to obtain of at least one line of first holes (2a) on each one of two tubular elements (2) allotted to embody the end manifolds, to insert the ends of pipes (3) destined to embody the radiating elements in the first holes (2a), and to join by welding the ends of the radiating elements (3) to the two end manifolds (2). Then two pipe rows facing each other (4) are applied as outer radiating elements. It is also provided for an heating radiator including two tubular elements (2) embodying the end manifolds, several pipes (3) embodying a central set of radiating elements and having their ends inserted into a line of first holes (2a) obtained in the end manifolds (2) and several pipes (4) embodying the radiator outer radiating elements. <IMAGE>
