Abstract (en)
[origin: EP1193181A2] The width(B1) of the box's first(30) and second(32) wall elements forming an inner space is greater than the width(B) of the front(12) or rear(14) wall element so that when folding up the box they spread out to form the chamber. The width(B1) is selected so that in the spread out state the product can be inserted into the space and detachably clamped. The inner space is connected to the inner wall of the packing case by a first(22) and second(46) glued flap so that in cross section it does not touch the inner wall of the case.
