Abstract (en)

[origin: EP1193201A1] The method for forming a stream of overlapping printed material, each overlapping section being made up of two different types of product (4, 5), comprises feeding the different products in an alternating arrangement from a rotating drum (21) on to a conveyor belt (2) which is moving in the same direction. The distance between products around the drum and the speed of the drum and conveyor are adjusted so that the second product is laid exactly on top of the first while another of the first is being laid down so it overlaps the second product. An Independent claim is included for a machine for carrying out the method.
