Abstract (en)
[origin: WO0052280A1] The invention relates to a locking system for wall lining plates, whereby the wall lining plates comprise a plate base body which is provided with a surface structure and/or surface shaping on the visible side thereof. The plate base body engages, with the lateral plate edges thereof, above and/or below the plate edges of adjacent wall lining plates. A drainage channel is formed on a lateral vertical plate edge situated on the plate base body. In order to ensure a controlled drainage of water out of the drainage channel, the invention provides that the lower horizontal plate edge is provided with a spring and the upper horizontal plate edge is provided with a groove that is matched to said spring. In addition, the drainage channel is led into the groove of the wall lining plate attached underneath, and the groove, at the groove ends thereof, is led into the discharge channel.
