Abstract (en)

[origin: DE10012751A1] Device comprises a support (1) along which an element (2) to be moved is displaced. Movement is achieved using a piezo-electric actuator assembly that is supported by the element. The actuator works and is controlled so that it executes step by step movement of the element on the support. The element is mounted in support (1) which has an open or closed hollow profile and is supported against said body, at least at one point by the interposition of a spring (8).
