Abstract (en)

[origin: EP1195310A1] The device has a drive rod and cam rods (5) connected to switch blades. The rods are positively locked together by locking elements (13,11), and are relatively moveable within a pattern when the locking elements are released. The cam rods are coupled to a central working flange (2). The flange and a working part (1) on the drive rod are relatively moveable within a first pattern, and positively locked via the locking elements. The drive rod is connected to the working part via a bearing pin (11). A second pattern is formed by two bores (9,10), through which the bolt is inserted.
