Abstract (en)
[origin: DE10049645C1] The fitting (1) has a valve (4) with a valve body (5) that has lower (9) and upper (10) float bodies arranged in a float casing (8) inside a cistern (2). The valve body is supported only by the lower float body during the partial flush and by both float bodies during a total flush. During the partial flush, the lower float body is held fixed in the float casing by the force of a magnetic counter bearing (14). A carrier is provided at the valve body, which is raised by a larger stroke of the valve body to lift the lower float body for the total flush against the force of the magnetic counter bearing.
