Abstract (en)  
[origin: WO0187131A1] The invention concerns a removable container (44) for collecting waste separated by a cyclone or inertial device for a waste collecting apparatus such as a vacuum cleaner, said container comprising several walls (45a, 45b, 46, 48) defining a storage volume (54). One of said walls (46) forming the base of the container (44) called base wall, and at least another wall (48) provided with an opening (49), called link wall are characterised in that: the base wall (48) and the link wall (48) are adjacent having, either a curve of one and/or of the other, or an inclination between said walls; the opening (49) of the link wall (48) is located immediately proximate to the adjacency zone between said wall and said base wall (46). The invention is characterised in that the bin (44) is in ventilating connection with the device sorting the waste through the opening (49) of the link wall (48) when it is arranged within the suction system.
