Abstract (en)

[origin: WO0107729A1] The invention concerns components (1, 2) made of wooden material, having, along their longitudinal faces (7), mutually adapted projections and/or recesses, enabling them to be assembled. In the lower face (15) of each component (1, 2) are formed two recesses (8, 9, 8', 9') in the form of grooves, designed to house parts for retaining (10, 12) at least a fixing clip (11) placed beneath the component (1, 2). The retaining parts (10, 12) extend upwards, from the clip base body (17). One of the two retaining parts (10) can be pressed against the inner surface (13), close to the face, of a recess (8, 9') of one (1) of the components and the other retaining part (12) can be pressed against the inner surface (20), close to the face, of the recess (8, 9') of the component (2) placed beside the first component and against it. One of the retaining parts (10) is a flange extending upwards. The invention is characterised in that the other retaining part, designed to be engaged in the recess (8', 9) of the joint component (2) is formed by a snap-on branch (12) which, from the clip base body (17), without being stressed, extends obliquely upwards, towards a plane defined by the faces (7) of the components (1, 2), acts as a spring or can be deflected with an elastic return force.
