Abstract (en)

[origin: WO0103081A1] A dynamically branded transaction execution system and method including member institutions, a number of transaction execution machines (TEMs), and a processing and routing system to connect and process information between the member institutions and the TEMs. Each of the TEMs contain an identification device and a user interface, and optionally a material device. When a customer uses one of the TEMs, the user interface is subsequently modified to a full service transaction machine. The TEM is dynamically branded such that it behaves as though it were owned by the member institution for the duration of the customer's transaction and provides the full service desired by the customers of the selected member institution. Different forms of communication can include a display, a keypad or touch pad, an audio and video system. Different ownership and licensing arrangements of the transaction execution system with a plurality of membership institutions is provided.
