Abstract (en)
[origin: EP1197297A1] The device comprises a container (10) which receives solid sublimable particles or blocks of solid sublimable material (18). A rotating disc is in contact on one of its surfaces, which has a series of teeth (15), with the particles. During disc rotation the teeth form particles with an average diameter less than 6 mm which are passed through passages in the disc. Independent claims are included for the processing method and the method of preparation of the solid particles.
