Abstract (en)

[origin: EP1197449A1] A conveying rotor (4) holds the front edge of printed product removed from the stack of signatures (2), in conveying direction. A conveying belt (16) driven in same direction as the rotor conveys the signatures to a processing line. A suction head (11) is attached to a pivotal control shaft arranged in parallel to rotational axis of rotor to lift the signature off the stack of signatures to the recess of the rotor.
