Abstract (en)

[origin: EP1197936A2] The system has warning devices and possibly other line elements that respond to at least one hazard criterion connected to a two-wire line and a central station with stored warning device addresses and a program for monitoring warning device states. A test circuit checks the operating states of the network using a test unit. A test processor has evaluation software and a switch arrangement for selective connection of the test unit(s) to the line. The system has a number of warning devices (M1-Mn) and possibly other line elements that respond to at least one hazard criterion and are connected to a two-wire line (Linie A) and a central station connected to the line with stored warning device addresses and a program for monitoring warning device states. A test circuit (10) in the central station checks the operating states of the network using a test unit and contains a test processor (20,22) with evaluation software and a switch arrangement (30,33) for selective connection of the test unit(s) to the line. Independent claims are also included for the following: a method of measuring the resistance of sections or lengths of line in hazard warning systems and a method detecting a short circuit between the line and a screen.
