Abstract (en)  
[origin: EP1198044A1] The device has a slide block (30) movably attached to the machine (4) with a gap (35) wider than the wire (6) but narrower than an attachment element (3) on the wire end. The slide block can be subjected to a force to displace the attachment element against the gap, whereby the gap with the wire is aligned so that with the wire clamped no lateral forces act on the attachment element. Independent claims are also included for the following: a corona wire arrangement with a clamping device mechanism for an electrographic machine.
