Abstract (en)
[origin: WO0158301A1] The present invention comprises the main plate and the latch which has a radius which is increased in the clockwise direction on one surface of the cylindrical rotation section of the belt stopping member which is engaged so as to be separated by a distance larger than the thickness of the belt. Therefore, the belt can be stably stopped without forming a separate catching piece and a latchet in the belt, and the thickness of the buckle can be reduced.
