Abstract (en)

[origin: WO0109758A2] Computer-implemented methods and systems for estimating costs and benefits associated with disease management interventions provide a graphical user interface through which a user inputs population-specific data for a population to be treated or offered treatment in a disease management intervention. Costs and benefits associated with the disease management intervention are projected over a time period for the population based on the user-specified data. The costs and benefits are output to the user to facilitate evaluation of the economic impact of the disease management intervention.
