Abstract (en)
The clothes drying machine has a condenser (7) cooled with water that collects in the washing vessel (1) together with condensation water. During drying, the drain pump (6) is normally de-energized and is only energized temporarily, in order to discharge the water that collects in the washing vessel (1), when this water reaches up to a threshold level (L) which is slightly lower than the base (15) of a rotating drum (2) containing the clothes to be dried. <IMAGE>
