Abstract (en)  
[origin: WO0049491A1] A method of generating and processing a multilinked operation in a hyperlinked browser of a computer system is presented. A multilinked operation is an operation representing at least two links. A user is presented with a page in hyperlinked format with at least two links thereon and a browser (or server) records link selections of the user. More than one link (1) selection is recorded if the user selects a link (2) without unselecting all other previously selected link (1) selections. In response to the user selecting the recorded selections as a group, a multilinked operation is generated representing the recorded selections and processed to form a new hyperlinked format page.
