Abstract (en)
[origin: EP1201149A1] The bracelet clasp comprises two arms (1,2) articulated to each other by their first ends to enable the first arm to be folded on the second. The second ends of the arms are intended to be joined to two ends of a bracelet. The arms comprise mutual couplings (4,10) which hold them in the folded position. The second end of the first arm comprises a connector (9) with parallel articulation axes, one which connects the connector to the first arm and a second which connects it to an end of the bracelet. There is an activating part (18) which separates the connector.
