Abstract (en)

[origin: FR2797531A1] The invention concerns an electric power supply network, such as a public lighting network, in particular light poles, using an electric cable. Said network comprises at least an active electric conductor (Ph1, Ph2, Ph3) and consisting of several interconnected sections in series to sites for connecting said equipment. The invention is characterised in that the voltage booster means (E) are mounted in series on the active conductor (Ph1, Ph2, Ph3) of the cable (A) so as to prevent the voltage at one of said sites to fall below a predetermined value. The invention is useful for electric power supply networks.
