Abstract (en)  
[origin: WO0113397A1] The invention relates to an electromagnetic switching device with at least one drive coil (2) that displaces a contact support (3) to a position of actuation (x) when it is subjected to a pick-up current (Ia), thereby actuating at least one main contact (4). The contact support (3) simultaneously actuates an auxiliary switch (5) that is released from a latched initial position into an unlatched actuation position by the displacement of the contact support (3).
