Abstract (en)

[origin: EP1203743A1] The vehicle has a lifting device (3) whose height is detected by a measuring device designed so that at least two measured value transmitters constantly detect the lift height and supply output signals which are independent of each other. At least one measured value transmitter is formed by an incremental transmitter (11) and one can be formed by a potentiometer (12). The measured value transmitters are in active connection with the lift device through a common mechanical drive element such as cable pulley
