Abstract (en)

[origin: EP1203745A1] The vehicle has a lifting device and load pick-up means (5). The acceleration and/or speed of at least one movement of the load pick up means which can be generated by the moving device can be influenced in dependence on at least one operating parameter of the vehicle, e.g. the actual lift height of the lift frame and this operating parameter is detected at least approximately steplessly. The actual lift height can be continuously detected infinitely and the acceleration and/or speed of movement is then adapted continuously to the actual lift height
