Abstract (en)

[origin: WO0113601A1] The invention concerns a method for speeding up name resolution services. The aim of the invention is to minimize delays caused by name resolution services and to reduce the network load caused by the system in question. In a normal situation a first server (14) containing a predetermined public name (15) routes inquiries to a client's public name (15) to a first name resolution server (18). The aim of the invention is achieved by linking a definition to the predetermined public name (15) at the first server (14), the definition routing inquiries to the predetermined public name (15) to a second name resolution server (19) in accordance with a second name (16) contained in the definition. This name resolution server is located such that rapid data transmission is enabled, thus reducing delays caused by name resolution service as well as network load.
