Abstract (en)  
A squaring machine (1), particularly for cutting panels, constituted by a frame (9) which is articulated like a parallelogram and can slide on a horizontal flat carriage (3) along a path which is parallel to the cutting line; the frame (9) comprising, on a first stringer (9c), a bar (13) on which at least one locator (20) for the positioning of the panel is slidably provided, the machine comprising positioning elements, supported by the bar, which are adapted to adjust the locator (20) along the bar, and angle variation elements, provided on the frame, which are adapted for the adjustment, about a fulcrum, of the bar (13) with respect to the cutting line (6a), the elements being electronically controllable and being mutually correlated so as to determine the movement of the abutment in relation to the angle of the bar (13). <IMAGE>
