Abstract (en)
[origin: EP1205298A2] An axial compensation coupling is provided between the fixed position drive wheel (26) for the rubber cylinder (2) and the variable position shaft (23) for the rubber cylinder. A counter-press cylinder (1) cooperating with a rubber cylinder used for transferring the printed image. The rubber cylinder is mounted in an excentral rotary bearing (25) in order to vary the axial distance between it and the counter-press cylinder. The rubber cylinder is connected to the counter-press cylinder via a wheel tensile mechanism (26, 36).
