Abstract (en)

The present invention proposes an auxiliary frame and a method for working the same. The proposed auxiliary frame comprises a plurality of frame bars made of plastic or metallic material. Each of the frame bars has a hollow inside and has a reinforcing rib and a reinforcing girder. The frame bars are assembled to form an auxiliary frame via a plurality of screws. The auxiliary frame can achieve superior strength and better moisture-proof and waterproof effects so that it will not easily rot. Moreover, natural wood material can be saved greatly, conforming to the requirement of environment protection. Additionally, the auxiliary frame can help to lacquer a rustic color on the wood material of the frame or to dip the wood material of the frame in fireproof solution, thereby forming a fireproof high-class doorframe or window frame. For the auxiliary frame of the present invention, it is not necessary to discard wall material and floor material when the frame has rotted. Therefore, the drawbacks in prior art such as waste of time, labor, and material, and mess and inconvenience of the working place can be avoided. <IMAGE>
