Abstract (en)

[origin: WO0109457A2] The known roof-tile binders (2) for use in the laying of tiles on roof constructions with sub roof (102) are very sensitive to incorrectly-selected rafter dimensions. When the tile binder is mounted, this can give rise to the tile being exposed to an undesired, outwards-directed force (26) at the upper end (24) of the tile. To remedy this disadvantage, a method and a tile binder (40) are disclosed whereby the insertion part (42) is inserted from the upper end of the boss (5), and where the binder (40) comprises an elasticity-providing part (50) and a gripping end part (52) with an obtuse, projecting end (54) which engages with the underside (118) of the rafter (110) at the foot of the tile, followed by a tensioning of the elasticity-providing part (50) during displacement of the tile (6) with the laying boss (7) sliding on the rafter (110) until the underside (28) of the tile is in abutment with the rafter, with the back (9) of the laying boss (7) in abutment with the upper side (116) of the rafter. It is hereby achieved that regardless of incorrectly-dimensioned rafters (110), there is always a downwards-directed force on the tile (6).
