Abstract (en)

[origin: WO0145201A1] The invention relates to a transportable, autonomously working system acting as the network node between networks for transmitting analogue, digital and/or pulse-modulated signals in communications connections between a satellite and switching centres for extensions and/or terminals. The inventive system comprises antennas, modules, walls, doors and/or ventiducts. The invention also relates to a method for producing the communications connections by automatically levelling the system and calculating the data for controlling the satellite antenna after the geographical location and the north-south position of the system have been detected.
