Abstract (en)

[origin: EP1207258A2] The lock includes an activation shaft connectable on the outside of the door with a lock activation, such as a handle, a cylinder lock, or similar, and is connected firmly at the interior with a friction tongue. The friction tongue is movable through turning the activation shaft between an unlocked position and a locked position. A relative movement of the casing with respect to the activation shaft (13) fixed in the locking position of the friction tongue (15) is enabled through the arrangement of the activation shaft in longitudinal direction of the casing (10). An element (20), giving to the relative movement, is arranged between activation shaft and casing.
