Abstract (en)

[origin: EP1207290A2] The state of the combustion of an air/carburant mix in the combustion chamber (14) is measured. After measure signals are processed and sent in a logical processing unit form (46). There is at least one combustion control parameter, which is adjusted in order to obtain the desired combustion for cycles to follow. The control parameters are determined in order to optimise the combustion.
