Abstract (en)
[origin: EP1207500A2] Coin tester has a coin channel arranged between main (14) and guide support plates. A ramp surface is provided, which coins meet when inserted. The ramp surface (36) is formed on an elongated massive damping body (30) that is arranged to tilt around an axis parallel to the ramp surface. The damping body is supported on pins at its ends that are supported in bearings in the main or guide support plates. The mass distribution of the damping body, which is held against a stop projects it into the coin channel.
