Abstract (en)
[origin: WO0113764A1] A group of lockers or the like include at least a two neighbouring lockers; at least one locker includes a body forming a compartment having an open side, and a door of generally uniform cross section and of uniform curvature, this curvature lying upon a circle, the door being supported such that the door may be rotated from a closed position in which the open side of the compartment is substantially covered by the door, to an open position in which the open side of the compartment is substantially uncovered. The door's curve remains lying upon the same circle during rotation. There is a cavity between the two lockers in question, which accommodates the door whilst it is in the closed position. The cavity is covered by a covering member. This covering member includes a recess to accept the one edge of the door of the second locker. The door of the locker is substantially outside the body of the locker when the locker is in the open position. The door is supported upon pivot means supplied by one or more generally segmental shapes pivoted about the apex of the segmental shape.
